# Virtual IT for Small Businesses

The first few years are critical to any startup business. Reaching the break-even point and becoming profitable is a key factor to success.

A small businesses can start off with no technological assets, putting them at a competitive disadvantage, or they can burden themselves and procure costly IT infrastructure such as servers and software applications. Capital expenditures burden startup businesses during a time when every penny counts.

Falcon ITS provides startup small businesses with an innovative solution to their technological needs: Managed Virtual IT.

Virtual Infrastructure

means that IT resources such as servers, Web sites, backup solutions, applications and collaboration software are all hosted and managed off-site in a secure data center.

These resources are accessed through the Internet using a Web browser.

In addition to capital costs savings, Virtual IT frees small businesses from having to deal with computer network and server problems.

Since Virtual IT can be securely accessed from anywhere, employees working in different locations can collaborate on shared documents, access their E-mail, join a discussion group, post messages

or share contacts and calendars.

Since Falcon ITS' Virtual IT is compatible with smart phone technology, your E-mails, Calendars and Contacts will synchronize wirelessly with Outlook and with your smart phone.

Virtual IT is scalable. You purchase the number of users you need at a low price. You can scale up and down from 2-10 users as your business needs change.

For more information about Virtual IT, contact us for a complimentary, no-obligation consultation.
